Course: Organizational Leadership (1646) • Level: PGD (ELM)

Semester: Autumn 2026

Assignment No. 1 (Units 1-5)

SOLVED ASSIGNMENT GUIDE

(For Study & Reference)

Note: This guide is prepared for study and reference purposes. Students are advised to read the relevant units of the course book, understand the concepts, and then write the assignment in their own words. Do not copy this guide verbatim.

USMAN NOTES www.usmannotes.com

Question 1: The Concept of Organization and the Role of Leadership (20 Marks)

Q1. Define the concept of organization and explain the role of leadership in shaping the structure and effectiveness of educational organizations. (20 Marks)

Introduction

An organization is not simply a building, a budget or a chart on a wall. It is a living pattern of human relationships created deliberately so that people who could not achieve a purpose alone can achieve it together. A school, a college, a university department and an education office are all organizations in this sense: each brings together teachers, learners, administrators, support

staff, parents and resources, arranges them in some order, and directs their combined effort towards educational purposes. Understanding what an organization is, therefore, is the necessary first step in understanding educational leadership, because a leader does not lead people in a vacuum. The leader leads people inside a structure, and that structure can either help their work or hinder it at every step.

This answer first defines the concept of organization drawing on the classical and modern definitions used in organizational theory, and identifies the essential elements that every organization possesses. It then examines the formal and informal sides of organizational life, explains the main structural choices available in educational organizations, and analyses in detail how leadership shapes both structure and effectiveness. The argument running through the answer is that structure and leadership cannot be separated: a good structure without good leadership remains lifeless, while good leadership trapped inside a bad structure wastes its energy fighting the system instead of improving learning.

The Concept of Organization: Definitions

Chester Barnard defined an organization as a system of consciously coordinated activities or forces of two or more persons. This definition is valuable because it stresses three things: people, coordination and consciousness of purpose. Etzioni described organizations as social units deliberately constructed to seek specific goals, while Edgar Schein emphasised a rational coordination of the activities of a number of people for the achievement of some common explicit purpose, through a division of labour and a hierarchy of authority. Stephen Robbins brought these strands together by defining an organization as a consciously coordinated social

entity, with a relatively identifiable boundary, that functions on a relatively continuous basis to achieve a common goal or set of goals.

From these definitions, five essential elements emerge. First, an organization consists of people, and its quality can never rise far above the quality, motivation and relationships of those people. Second, it has a purpose or goal that gives direction and provides the standard against which success is judged. Third, it has a structure, that is, a deliberate arrangement of roles, responsibilities and relationships. Fourth, it involves coordination, because divided work must be reunited if the final product, in education the learning of the student, is to be coherent. Fifth, every organization exists inside an environment of parents, communities, governments, technology and culture, from which it draws its resources and to which it must remain responsive if it is to survive.

Formal and Informal Organization

Every educational organization has two sides. The formal organization is the official, planned side: the organogram, the timetable, the job descriptions of the principal, vice-principal, heads of department and teachers, the rules, the committees and the official channels of communication. It can be drawn, written down and inspected. The informal organization is the unofficial, spontaneous side: the friendships among teachers, the staffroom groupings, the respected senior teacher whose opinion carries more weight than any circular, and the unwritten norms about how much work is really expected. The informal organization is not a defect to be eliminated. It meets social needs that the formal system ignores, it carries information quickly, and it can support change powerfully when its leaders are won over. A

wise principal studies both sides, because a decision that looks perfect on the formal chart may fail completely if it collides with the informal life of the school.

Structure in Educational Organizations

Structure answers practical questions. Who reports to whom? How widely is authority spread? How many people does one supervisor oversee, which is the span of control? How strictly are behaviour and procedures controlled by rules, which is formalization? And how far are decisions taken at the top or pushed down to those closest to the classroom, which is centralization or decentralization? In a small primary school the structure is usually simple and tall in miniature: a head teacher, perhaps a senior teacher, and classroom teachers who each carry many duties. In a large secondary school or university the structure becomes differentiated, with departments, sections, examinations cells, finance sections and student-affairs offices, each requiring coordination. Bureaucratic features such as division of labour, hierarchy and written rules, described by Max Weber, bring predictability, fairness and continuity to schools, but when exaggerated they produce rigidity, slow decisions and teachers who follow the rule book instead of serving the learner.

Table 1: Two broad structural patterns in educational organizations

Structural choice	Centralized / tall form	Decentralized / flat form
Decision-making	Decisions taken by the principal or head office	Authority shared with departments and teachers
Communication	Long chain; slower but controlled	Shorter chain; faster but needs trust
Best suited to	Small schools, crises, strict compliance tasks	Large institutions, professional staff, innovation
Main risk	Bottlenecks, low morale,	Inconsistency, uneven quality if

	dependence on one person	uncoordinated

The Role of Leadership in Shaping Structure

Leadership shapes structure first by clarifying purpose. A leader who defines the mission of the school clearly, for example to raise literacy in the early grades or to improve science results, gives the structure something to serve, and roles that do not serve that purpose can be redesigned or removed. Second, the leader designs and redesigns roles. When a principal creates the post of literacy coordinator, establishes a data or assessment committee, or groups teachers into professional learning teams by grade rather than leaving them isolated in separate classrooms, the leader is literally reshaping the organization. Third, leadership decides how authority is distributed. A leader may retain every decision, or may practise distributed leadership by giving heads of department real authority over budgets, timetables and mentoring within their departments, thereby flattening the structure and building leadership capacity throughout the school.

Fourth, leadership builds the coordinating mechanisms that make a divided structure work as one whole: regular staff and departmental meetings with clear agendas, shared planning time, common assessment calendars, and information systems that show everyone the same picture of attendance and achievement. Fifth, leadership shapes structure through staffing and development. Recruiting, inducting, mentoring and appraising people are structural acts, because they decide who occupies each role and how competently that role will be performed. Finally, leadership protects the structure from being captured by routine. Structures tend to harden with time, so an effective leader reviews them periodically, asks whether the

committee, report or approval step still earns its cost, and has the courage to change arrangements that once worked but no longer fit the school and its environment.

Leadership and Organizational Effectiveness

Effectiveness in an educational organization means achieving valued educational goals, using resources responsibly, keeping staff and students satisfied and committed, and adapting to change without losing stability. Leadership influences every one of these tests. It influences goal attainment by setting clear, measurable priorities and monitoring progress honestly rather than allowing every activity to claim equal importance. It influences the internal health of the school by creating trust, fairness and professional respect, because teachers who feel trusted and fairly treated give discretionary effort that no rule can compel. It influences efficiency by removing duplication, sequencing work sensibly and protecting teaching time from unnecessary paperwork and interruptions. And it influences adaptability by scanning the environment, interpreting policy and technological change for staff, and preparing the school before a change is imposed upon it.

Research and common experience agree that leadership effects on learning are largely indirect but powerful. The principal rarely teaches every child, yet the principal decides the conditions under which every teacher teaches: the timetable, the allocation of the strongest teachers, the quality of feedback after classroom observation, the availability of materials, and the culture of expectation. A school with strong instructional leadership, where the leader knows the curriculum, visits classrooms supportively and discusses student work with teachers, will normally outperform a school of equal resources where leadership is confined to

administration and discipline. Effectiveness, therefore, is not produced by structure alone or by personal charisma alone; it is produced when a leader aligns structure, people, culture and resources behind a clear educational purpose and sustains that alignment over time.

Conclusion

To conclude, an organization is a consciously coordinated group of people, with a purpose, a structure, an identifiable boundary and a continuing life inside a wider environment. In educational organizations the formal structure of roles, rules and hierarchy and the informal structure of relationships and norms operate together, and both must be understood. Leadership is the force that gives structure its direction and its life: it clarifies purpose, designs roles, distributes authority, builds coordination, develops people and renews arrangements that have outlived their usefulness. When leadership performs these tasks well, the structure stops being a cage and becomes a scaffold that supports teachers and raises the effectiveness of the whole institution. When leadership neglects them, even a well-drawn organogram remains only paper, and the school drifts. The study of organizational leadership therefore begins exactly here, with the union of structure and leadership in pursuit of learning.

Question 2: Organizational Culture and the Behaviour of Teachers and Students (20 Marks)

Q2. Discuss the role of organizational culture in shaping the attitudes and behaviors of teachers and students. Provide examples from educational institutions. (20 Marks)

Introduction

Walk into two schools with the same syllabus, the same building standard and the same qualifications on staff, and within an hour a visitor can feel that they are different places. In one, teachers greet students by name, displays celebrate student work, staff speak of our school with pride and problems are discussed openly. In the other, corridors are silent and suspicious, staff arrive and leave exactly on time, cynicism greets every new idea and students describe the school as a place to be endured. That felt difference is organizational culture. It is one of the most powerful and least visible forces in education, because it shapes what teachers and students believe is normal, desirable and possible long before any formal rule is consulted.

This answer explains the meaning and layers of organizational culture, shows how culture is formed and transmitted, and analyses its role in shaping the attitudes and behaviour of teachers and of students, supported by examples from schools and colleges. It also notes the difference between strong and weak cultures and between a healthy culture and a toxic one, because culture is never neutral in its effects: a strong culture can carry a school towards excellence or lock it into failure, depending on the values that the culture contains.

Meaning and Layers of Organizational Culture

Organizational culture is commonly defined as the pattern of shared basic assumptions, values and beliefs that a group has learned as it solved its problems, and that is taught to new members as the correct way to perceive, think and feel. In simpler language, culture is the way we do things around here. Edgar Schein described culture at three levels. At the surface are artefacts, the visible things: the uniform, the assembly, the trophies in the cabinet, the

language used in notices, the condition of the noticeboard and the way visitors are received. Beneath artefacts lie espoused values, the stated beliefs of the institution, such as the motto on the wall, the mission statement and the professed commitment to honesty, merit or service. At the deepest level lie basic underlying assumptions, the taken for-granted beliefs that actually govern behaviour, for example whether staff truly believe that every child can learn, or privately believe that children from poor homes cannot succeed.

The deepest level matters most, because behaviour follows assumptions, not posters. A school may espouse the value that all children can learn, while its actual assumption, visible in low expectations, early labelling of weak students and acceptance of failure in certain classes, teaches the opposite lesson every day. Culture is formed through the history of the institution, the behaviour and example of its leaders, the stories told about heroes and failures, the rituals of assemblies, prize days and farewells, the reward system that shows what is really valued, and the daily experience of success or failure in solving problems together. Once formed, culture is transmitted to newcomers through induction, mentoring, informal advice and observation, so that a new teacher quickly learns what is praised, what is tolerated and what is never done here.

How Culture Shapes Teachers: Attitudes

For teachers, culture shapes attitudes towards the profession, towards students, towards colleagues and towards change. A culture of professionalism and trust produces teachers who see teaching as a vocation, expect success from their students, and regard a colleague's success as a credit to the whole school. Such teachers display what researchers call collective efficacy,

the shared belief that together the staff can improve learning, and this belief is one of the strongest cultural predictors of student achievement. By contrast, a culture of blame and low expectation produces defensive attitudes: teachers attribute failure entirely to students, parents or the government, protect themselves by doing the minimum, and view every innovation as extra unpaid work imposed from above. Attitudes towards change are particularly cultural. In a learning culture, a new method is an experiment to be tried and judged; in a comfortable or fearful culture, the same method is a threat, and the informal system quickly teaches the enthusiast to slow down and conform.

How Culture Shapes Teachers' Behaviour

Attitudes become behaviour in observable ways. In a collaborative culture, teachers share lesson plans, observe one another's classes, discuss assessment results openly, mentor new colleagues and stay beyond the bell to help students, not because a rule compels them but because that is what a good teacher does here. In an individualistic culture, described by Andy Hargreaves as the culture of the closed classroom door, teachers work alone, guard their materials, treat observation as inspection and compete quietly for the best classes and timetable. Culture also governs punctuality, preparation, honesty in examinations and willingness to take on co-curricular duties. Where the culture honours merit, a teacher who coaches the debate team or improves board results is publicly appreciated and others follow. Where the culture rewards connections and seniority alone, effort quietly withdraws, because staff learn that performance changes nothing.

How Culture Shapes Students: Attitudes and Behaviour

Students read the culture of a school even more quickly than adults do, and they respond to the real culture, not the announced one. A culture of respect, fairness and high expectation shapes students who value learning, believe effort leads to success, feel safe to ask questions and develop pride and belonging in their institution. Rituals such as morning assembly, house competitions, student councils and celebration of achievement in academics, sports and character teach identity and loyalty. Conversely, a culture in which rules are applied unfairly, teachers use humiliation, cheating is winked at or success is believed to depend on tuition and influence teaches students cynicism, fear and dishonesty. Students then behave accordingly: attendance becomes reluctant, homework becomes copying, discipline problems multiply and the ablest students invest their real energy outside the school. The hidden curriculum of culture, in short, often teaches more lasting lessons than the formal curriculum.

Table 1: How contrasting cultural features shape behaviour in a school

Cultural feature	Effect on teachers	Effect on students
High expectations for all	Teachers plan ambitiously and persist with weak learners	Students believe effort succeeds; aspiration rises
Collaboration and trust	Sharing, peer observation and mentoring become normal	Cooperative learning and peer support increase
Fair rewards and recognition	Effort and merit are repeated and spread	Honesty and hard work are seen as worthwhile
Blame, fear and favouritism	Defensiveness, minimum effort, resistance to change	Cynicism, cheating, disengagement and indiscipline

Examples from Educational Institutions

Consider first a government high school in which the head teacher begins every term by publicly reviewing results class by class, not to shame teachers but to set shared targets, celebrates the most improved class as warmly as the top class, and protects a weekly period in which subject teachers plan together. Within two years the staffroom conversation changes from complaints about students to discussion of methods, senior teachers begin mentoring juniors voluntarily, and students respond with better attendance and a visible pride in inter-school competitions. No rule was changed; the culture was changed, and behaviour followed. Consider, in contrast, a college where appointments to committees, examination duties and promotions are widely believed to follow favouritism, where the principal communicates mainly through warnings, and where a teacher who reported cheating was left unsupported. In that culture, capable teachers stop volunteering, examination malpractice becomes an open secret that students treat as normal survival, and new staff learn within months that silence is the price of peace.

Universities show the same pattern at a higher level. An institution whose culture prizes research, academic freedom and honest inquiry produces teachers who publish, supervise seriously and encourage students to question and debate. An institution whose culture prizes only enrolment numbers and administrative obedience produces teachers who avoid intellectual risk and students who memorise for degrees rather than learn for understanding. In Pakistan's context, the strong culture of a well-led cadet college, a missionary school or a high-performing private school system, with its rituals, alumni loyalty, house system and uncompromising expectation of discipline and effort, demonstrates how deliberately built

culture can sustain standards across generations of staff and students, while the rapid decline of once-famous public institutions often begins culturally, with the loss of expectation and pride, before it appears in results.

Strong, Weak, Healthy and Toxic Cultures

A strong culture is one in which core values are widely shared and strongly held; a weak culture is fragmented, with subcultures in departments or staff groups pulling in different directions. Strength alone is not goodness. A strong toxic culture, united around low expectations and resistance to outsiders, is harder to change than a weak one. The leader's task is therefore twofold: to strengthen the culture around healthy values such as learning, honesty, inclusion and service, and to weaken the grip of unhealthy assumptions by modelling the new values personally, rewarding behaviour that expresses them, telling new stories of success, and patiently repeating the message until the taken-for-granted assumptions themselves begin to shift. Culture change is slow because assumptions are deep, but it is the deepest form of improvement a leader can achieve.

Conclusion

To conclude, organizational culture is the shared pattern of assumptions, values, rituals and stories that tells teachers and students what is normal and valued in their institution. It shapes teachers' attitudes towards students, colleagues, effort and change, and converts those attitudes into behaviour in collaboration, punctuality, honesty and professional growth. It shapes students' attitudes towards learning, fairness and belonging, and their behaviour in effort, discipline and integrity. Examples from schools, colleges and universities show that

culture can be a school's greatest asset or its heaviest burden, and that it is formed less by statements on walls than by what leaders do, reward, tolerate and repeat. For the educational leader, therefore, building a healthy culture of high expectation, trust and learning is not a soft extra beside the real work; in the long run, it is the real work.

Question 3: Organizational Diversity, Equality and Inclusion in Schools (20 Marks)

Q3. Schools often consist of individuals from diverse backgrounds. Explain the aspects of organizational diversity and discuss how school leaders can promote equality and inclusion. (20 Marks)

USMAN NOTES www.usmannotes.com

Introduction

No two people enter a school as identical copies of one another. A single classroom may contain boys and girls, speakers of several mother tongues, children of wealthy professionals and of daily-wage labourers, students of different faiths and sects, fast learners and students with disabilities, and teachers who differ in age, training, region and outlook. This human variety is organizational diversity, and in education it is not an occasional complication but the normal condition of the institution. How a school understands diversity, and whether its leader treats it as a problem to be suppressed, a fact to be tolerated or a resource to be valued, will decide whether many of its students receive a genuinely equal chance to learn.

This answer first explains the meaning of diversity in organizations and then examines its main aspects or dimensions as they appear in schools, including primary and secondary dimensions

and the diversity found among staff as well as students. It then discusses, in practical detail, how school leaders can promote equality and inclusion through policy, curriculum, staffing, classroom practice, language, accessibility and culture, and it distinguishes carefully between treating everyone identically and treating everyone equitably, because genuine equality often requires different support for different needs.

Meaning of Organizational Diversity

Organizational diversity means the variety of differences among the people who belong to or are served by an organization. In a school it covers the students, teachers, administrators, support staff and, in a wider sense, the parents and community whose values enter the school each morning. Diversity is valuable for two reasons. Morally and legally, every child has a right to education without discrimination, a principle affirmed in Pakistan's constitution and in international commitments to education for all. Educationally, diversity is a resource: different experiences enrich discussion, different languages and talents widen the life of the school, and learning to live respectfully with difference is itself one of the most important lessons a school can teach in a plural society. Yet diversity unmanaged can also produce misunderstanding, grouping, prejudice and conflict, which is why leadership, not mere presence, determines its effects.

Aspects and Dimensions of Diversity in Schools

The primary dimensions of diversity are those largely given and generally not changeable: gender, age, ethnicity and race, language and mother tongue, physical and mental ability or disability, and, in the wider community, nationality and regional origin. In Pakistani schools,

language diversity is especially significant, because a child whose home language is Punjabi, Sindhi, Pashto, Balochi, Saraiki or another language may be taught through Urdu or English, and this single fact can decide whether the child understands the lesson or silently falls behind. Gender diversity raises questions of girls' enrolment, safety, facilities and expectations. Ability diversity ranges from gifted learners to children with visual, hearing, physical or intellectual disabilities, each requiring recognition rather than neglect.

The secondary dimensions are acquired or changeable and include educational background and qualifications, socio-economic status and family income, religion and sect in its practised observance, geographic location such as urban or rural origin, marital and family circumstances, work experience, learning style and political or social outlook. Among teachers, diversity includes subject specialisation, training institution, years of experience, contract or regular status and technological skill. Among students it includes prior schooling, tuition access and family support for study, which quietly create unequal starting points inside the same classroom. A further aspect is diversity of thought and personality: some learners are analytical, others creative; some teachers are innovators, others consolidators. A complete account of diversity must also recognise intersection, the way dimensions combine, so that, for example, a poor rural girl with a disability faces barriers that are greater than any one of those conditions alone.

Table 1: Main aspects of diversity in educational organizations

Dimension	Examples in a school	Risk if ignored
Gender	Girls and boys; female and male staff	Girls dropout, unsafe environment, stereotyped subjects

Language	Different mother tongues; Urdu/English medium	Silent failure, loss of confidence in early grades
Socio-economic status	Rich and poor families; tuition gap	Homework and materials favour the affluent
Ability and disability	Gifted learners; visual, hearing, physical disabilities	Exclusion, labelling, wasted talent
Culture, faith and region	Different ethnic, religious and regional groups	Prejudice, grouping, conflict and mistrust
Experience and viewpoint	New and senior teachers; different learning styles	Wasted ideas, staff friction, narrow teaching

Equality, Equity and Inclusion: Key Distinctions

Three related ideas must be distinguished. Equality means that every person has the same rights, dignity and access in principle: admission, participation and protection from discrimination must not depend on background. Equity means fairness in practice, recognising that identical treatment of unequally placed learners can preserve inequality, so additional support, such as remedial teaching, assistive devices, fee support or extra time, is given where need is greater. Inclusion goes further than simply placing a different child inside an ordinary school. An inclusive school changes its own arrangements, teaching, buildings, assessment and attitudes so that every learner belongs, participates and progresses. A child in a wheelchair who is admitted but cannot reach the classroom or the laboratory is enrolled but not included; a girl who attends but is never encouraged in science is present but not equally served. Leaders must pursue all three ideas together.

How School Leaders Can Promote Equality and Inclusion

First, the leader sets policy and models values. A written commitment against discrimination, transparent admission and staff-recruitment criteria, fair allocation of classes, duties and opportunities, and the leader's own visible respect for every group teach the institution what it stands for. Second, the leader makes access real: ramps and accessible washrooms where possible, safe transport and separate facilities that keep girls in school, fee concessions and textbook support for poor students, and timetables that do not systematically disadvantage any group. Third, the leader shapes the curriculum and materials, pressing for content that represents different regions, languages and contributions fairly, removing biased examples, and valuing students' home cultures as bridges to learning rather than defects to be corrected.

Fourth, classroom practice must be led and supported. Teachers need training in differentiated instruction, mixed-ability grouping, questioning that reaches girls and quiet learners as well as confident boys, early use of the child's mother tongue as support where feasible, and assessment accommodations that test knowledge rather than disability. The leader supports this through observation focused on participation: who is asked questions, who leads groups, who is praised and who is ignored. Fifth, staffing matters. Recruiting and developing teachers from under-represented groups, ensuring women teachers are available especially for girls' schools, and distributing experienced teachers fairly instead of concentrating them in favoured classes are leadership decisions with direct equality effects. Sixth, the leader builds an inclusive culture and language: names and identities are pronounced and treated respectfully, bullying and discriminatory remarks are addressed promptly and educationally, festivals and

achievements of different communities are acknowledged within school policy, and parents from all backgrounds are welcomed as partners rather than kept at the gate.

Finally, inclusion must be monitored with evidence. A principal who disaggregates attendance, dropout, participation and results by gender, class section and, where appropriate, disability or language group will discover inequalities that general averages conceal. A school may celebrate an overall pass rate of eighty percent while girls in one section or students in the afternoon shift fail at twice the average rate. Monitoring must be followed by action: targeted remedial classes, mentoring, counselling, adjustment of teaching groups, and review of whether the action worked. Student voice also belongs here, through councils and feedback in which minority and quieter students are deliberately heard, because those who experience exclusion are the first to know where it happens.

Challenges and the Leader's Response

Leaders will meet real challenges: scarce funds for accessibility and support staff, community prejudices, parental resistance, large classes that make differentiation difficult, and teachers who sincerely believe that treating everyone identically is the only fairness. These challenges explain slow progress but do not excuse inaction. The effective leader sequences reform, beginning with low-cost, high-signal steps such as fair questioning, anti-bullying action, respectful language, transparent criteria and data review, while building the case and alliances for costlier changes. The leader also frames inclusion correctly, not as charity towards a few but as better education for all, since teaching that reaches the margins, with clarity, variety and support, improves learning for the whole class.

Conclusion

To conclude, diversity in schools spans primary dimensions such as gender, language, ethnicity and ability, and secondary dimensions such as socio-economic status, education, faith, region, experience and learning style, among students and staff alike, often in combination. Diversity brings richness and also risk. Whether it becomes a resource depends on leadership that joins equality of rights, equity of support and genuine inclusion in the life of the school. Through fair policy, real access, representative curriculum, supported classroom practice, balanced staffing, respectful culture and evidence-based monitoring, a school leader can ensure that difference is never converted into disadvantage. That is both a professional duty and the deepest meaning of education in a diverse society: every learner known, valued and given a fair chance to succeed.

Question 4: Types of Communication and Coordination in Educational Organizations (20 Marks)

Q4. Describe the types of communication used in educational organizations. Analyze how effective communication improves coordination among teachers, administrators, and students. (20 Marks)

Introduction

An educational organization runs on communication as surely as a body runs on its nervous system. A decision taken by a principal has no effect until it is communicated; a student's difficulty remains invisible until it is expressed; a teacher's good idea benefits one classroom

only until it is shared. When communication works, hundreds of separate daily actions by teachers, administrators and students join into coordinated education. When it fails, the same people work hard in confusion, duplicate one another's efforts, miss deadlines, misunderstand instructions and lose trust. Communication is therefore not a clerical extra in school management but one of its central leadership functions.

This answer describes the main types of communication used in educational organizations, classified by direction, by formality, by medium and by the distinction between verbal and non-verbal communication. It then analyses how effective communication improves coordination among teachers, administrators and students, using the practical machinery of a school, its timetable, meetings, assessment and daily problem-solving, as evidence. It also identifies common barriers and the leader's responsibility for removing them, because coordination depends not merely on sending messages but on achieving shared understanding.

The Communication Process in Brief

Communication is the transfer of information, ideas, feelings and instructions from a sender to a receiver in such a way that understanding results. Its elements are the sender, the message, encoding into words, symbols or gestures, a channel or medium, the receiver who decodes the message, feedback that confirms or corrects understanding, and noise, which is anything that distorts the message on its journey. This simple model explains many school failures. A circular written in difficult official language may be sent on time yet never understood; a verbal instruction passed through three people may arrive changed; a message delivered without any

chance of questions provides no feedback and therefore no check on misunderstanding. Effective leaders manage the whole process, not only the sending.

Types of Communication by Direction

Downward communication flows from higher to lower levels: from the education department to the principal, and from the principal to teachers and students. It carries policies, curricula, timetables, examination instructions, targets and feedback on performance. Its strength is authority and clarity of responsibility; its weakness is distortion and delay as it passes through levels, and the temptation to make it one-way command. Upward communication flows in the opposite direction: teachers report results, difficulties and suggestions to the principal, students communicate needs and grievances, and the principal reports to higher authorities. It is the organization's early-warning system, and it flourishes only where staff believe that honest information will be heard without punishment. Horizontal or lateral communication flows between people at the same level, teacher to teacher, department to department and student to student. It coordinates the daily work that no hierarchy can supervise minute by minute, such as shared planning, cover for absent colleagues and joint events. Diagonal communication cuts across levels and departments, for example when a teacher communicates directly with an accounts clerk or a district officer's staff about a specific matter, saving time when used with proper information to the immediate supervisor.

Formal and Informal Communication

Formal communication follows official channels and is usually recorded: circulars, notifications, minutes, service rules, attendance and result registers, official letters, reports and, in modern

institutions, the learning-management system and official email or messaging groups. It provides authenticity, accountability and a record that can be checked later, which is essential in examinations, finance, discipline and appointments. Informal communication, often called the grapevine, travels through personal and social relationships: staffroom conversation, corridor discussion, phone calls and unofficial groups. It is fast, it carries feelings and reactions that formal channels miss, and it fills gaps left by official silence. It can also carry rumour and distortion. A wise administrator does not pretend the grapevine can be abolished; instead he keeps formal communication so prompt, complete and honest that rumour has little empty space in which to grow, and he listens to the grapevine as evidence of what staff are really worried about.

Verbal, Non-Verbal and Written Communication

Verbal communication uses spoken words: assemblies, classroom teaching, staff meetings, interviews, telephone calls and parent meetings. It is immediate, personal and rich in feedback, making it best for discussion, motivation, counselling and resolving misunderstanding. Written communication uses the written word in notices, letters, reports, handbooks, newsletters and digital messages. It is slower but permanent, precise and suitable for detailed instructions and records that many people must follow identically. Non-verbal communication conveys meaning without words: facial expression, tone of voice, posture, punctuality, the arrangement of an office, a principal's presence in the corridor, and even silence. In schools non-verbal messages are unusually powerful, because students and staff judge whether words are sincere by watching behaviour. A principal who speaks of punctuality while arriving late communicates the

opposite lesson without saying a word. Visual and digital communication, charts, displays, dashboards, presentations, websites and social media, now combines these forms and extends the school's communication to parents and community at a speed earlier generations did not possess.

Table 1: Types of communication in educational organizations

Type	Typical school examples	Main strength	Main risk
Downward	Circulars, timetable, targets, instructions	Authority and clarity	Distortion; one-way command
Upward	Reports, suggestions, grievances, results	Early warning; participation	Fear suppresses honesty
Horizontal	Department planning, peer sharing, cover arrangements	Daily coordination and teamwork	Cliques; inconsistent messages
Formal written	Minutes, notifications, records, LMS messages	Record, precision, accountability	Slow; language may be unclear
Informal / grapevine	Staffroom talk, unofficial groups	Speed; reveals real concerns	Rumour and distortion
Non-verbal	Example, presence, tone, punctuality	Credibility; shapes culture	Contradicts spoken message if careless

How Effective Communication Improves Coordination

Coordination means arranging separate activities so that they support rather than obstruct one another and together achieve the common goal. Effective communication improves coordination first by creating a shared understanding of goals and plans. When every teacher knows the term's priorities, the examination calendar, the syllabus coverage expected and the criteria for assessment, independent classrooms move in the same direction without constant supervision. Second, it synchronises time and resources. The timetable, substitution

arrangements for absent teachers, booking of laboratories, libraries and halls, and the scheduling of tests and events are all communication products; a single clear, timely notification prevents the collisions and idle gaps that waste teaching time.

Third, communication coordinates through feedback and correction. Upward reports on syllabus progress, item analysis of test results and classroom difficulties allow administrators to adjust support, reallocate time or arrange remedial teaching before small gaps become final failure. Fourth, it coordinates people emotionally as well as technically. Teachers who are consulted, informed early about changes and given reasons for decisions are far more willing to cooperate across departments and to accept inconvenient duties for the sake of the whole. Fifth, communication with students coordinates expectations and behaviour: clear rules, explained assessment criteria, prompt feedback on work and accessible channels for questions and grievances turn students from passive recipients into partners who know what is required and by when. Sixth, communication with parents and the community aligns the school's work with support at home, on attendance, homework, health and conduct, extending coordination beyond the school gate.

A concrete example makes the mechanism plain. Suppose a school introduces a common monthly test system. Coordination succeeds only if the purpose is explained downward convincingly, departments agree dates horizontally to avoid overloading students, teachers report upward honestly when a test clashes with unfinished syllabus, administrators adjust the calendar and inform everyone in writing, students receive criteria and dates in time to prepare, and results are communicated back quickly with discussion of what they mean. Remove any one link and the same reform produces chaos: clashing tests, resentful staff, surprised students

and data nobody uses. The reform did not change; the communication did. This is why experienced administrators treat the design of meetings, notices, reporting formats and feedback routines as seriously as the design of the reform itself.

Barriers to Effective Communication

Barriers include unclear or overloaded messages, difficult language and jargon, poor choice of channel, excessive hierarchy, fear that suppresses upward honesty, prejudice and selective listening, emotional states, physical noise and distance, and the modern barrier of information overload through constant digital messages that bury the important among the trivial. Each barrier has a managerial remedy: write and speak plainly, choose the channel to fit the message, confirm understanding through feedback and questions, keep important messages few and clearly marked, invite upward communication and protect those who give it, listen actively, and maintain records so that verbal instructions can be checked against written ones. Above all, the leader's own consistency between word and action is the foundation on which all other communication stands.

Conclusion

To conclude, educational organizations use downward, upward, horizontal and diagonal communication; formal and informal channels; and verbal, written, non-verbal and digital forms, each with distinct strengths and risks. Effective communication improves coordination by building shared purpose, synchronising time and resources, feeding back information for correction, winning the willing cooperation of teachers, guiding the expectations of students and aligning parents with the school. In its absence, even capable people work at cross

purposes. The educational leader is therefore, in a very literal sense, a chief communication officer: the quality of what is said, heard, recorded and understood in the institution sets the limit to how well its separate parts can ever work as one.

Question 5: Stages of Team Development and the Role of the School Principal (20 Marks)

Q5. Explain the stages of team development. Analyze how a school principal can guide teachers through these stages to create an effective teaching team. (20 Marks)

Introduction

Almost every important task in a school is too large for one person. Improving literacy across six grades, running examinations honestly, preparing a science exhibition or raising the quality of teaching in a whole department requires a team, a group of people with complementary skills who are committed to a common purpose and hold themselves accountable to one another. Yet simply placing teachers in a group and calling it a team does not create teamwork. Teams grow, struggle, mature and sometimes fail in recognisable patterns, and a principal who understands those patterns can guide teachers through them instead of being surprised or defeated by them.

This answer explains the stages of team development, principally the model proposed by Bruce Tuckman, forming, storming, norming, performing and the later-added adjourning stage, describing what members feel and do at each stage and what can go wrong. It then analyses, stage by stage and as a continuing responsibility, how a school principal can guide teachers

through the process to create an effective teaching team, including the selection of members, the setting of goals, the management of conflict, the building of norms and trust, and the recognition and renewal of mature performance.

What Makes a Group a Team

A team differs from a mere working group in the depth of its interdependence. In a working group, members share information but each remains responsible mainly for an individual result, as when teachers of separate classes exchange notices at a staff meeting. In a real team, members need one another's work to succeed: the grade team that jointly plans the curriculum, teaches different components, assesses together and shares responsibility for the progress of the same cohort of students succeeds or fails together. Teams therefore require a common and meaningful goal, complementary skills, agreed ways of working, mutual trust and collective accountability. These qualities are not installed by announcement. They develop over time, which is precisely what the stages model describes.

Stage One: Forming

Forming is the stage of orientation and polite uncertainty. Members have just been brought together, for example a newly formed team of Grade 6 teachers or a committee for improving board results. They are courteous, cautious and dependent on the leader for direction. Questions dominate: What exactly is our task? What is expected of me? How much time will this take? Who else is involved and how do they work? Contributions are tentative, real disagreements stay hidden, and productivity is modest because energy is being spent on finding a place in the group. The risks of this stage are false harmony and vagueness: if purpose,

membership and ground rules are left unclear, confusion stored up now will explode later. Forming ends when members accept the task and one another sufficiently to begin real work.

Stage Two: Storming

Storming is the stage of conflict and testing, and it is the stage at which many school teams are wrongly declared failures. As members begin to work, differences emerge over goals, methods, workload and leadership. One teacher wants frequent common tests, another defends professional autonomy; a senior teacher's authority is challenged; subgroups and alliances form; frustration with slow progress is directed at the leader or at one another. Emotions run higher, attendance and enthusiasm may dip, and some members may withdraw or dominate. Yet storming is not simply destructive. It is the process by which hidden assumptions are surfaced, real priorities are contested and honest roles are negotiated. A team that never storms has usually suppressed its differences rather than resolved them, and the suppressed conflict returns later in a worse form. The danger is only that conflict becomes personal and permanent instead of remaining focused on the task.

Stage Three: Norming

Norming begins when the team starts to resolve its differences and to create its own agreed ways of working. Roles become clear and accepted, ground rules for meetings, preparation, decision-making and sharing of work are established, and members begin to trust one another's competence and intentions. Communication becomes more open, feedback can be given without immediate defensiveness, and a sense of identity and cohesion appears: members start to say we when describing the team's work. The leader's direct control can relax as shared

norms begin to regulate behaviour more effectively than supervision ever could. The risk at this stage is comfortable conformity, in which preserving harmony becomes more important than questioning a weak idea, a tendency known as groupthink. Healthy norming therefore includes a norm of respectful dissent, so that agreement remains honest.

Stage Four: Performing

Performing is the mature stage at which the team's energy is finally directed almost entirely to the task. Members are competent, autonomous and interdependent; problems are identified early and solved by the team itself; roles can flex as the work demands, so that a member may lead one activity and support in another; and disagreement is handled constructively as information rather than threat. A performing teaching team plans together, observes and improves one another's practice, analyses results honestly and adjusts its teaching as a unit, producing outcomes that no collection of isolated individuals could match. Not every team reaches this stage, and no team stays there automatically: changes in membership, leadership or task can return a team to storming or norming, which the leader must recognise without panic. Performance is a condition to be maintained, not a prize won once for all.

Stage Five: Adjourning

Adjourning, added by Tuckman with Mary Ann Jensen in 1977, is the stage of ending, relevant to teams formed for a defined task such as an accreditation committee, an examination team or a one-year improvement project. Members may feel pride and satisfaction at completion together with sadness or anxiety at separation and uncertainty about what follows. If endings are handled badly, lessons are lost, contributions go unrecognised and members carry cynicism

into the next team. Handled well, adjourning consolidates learning: results are reviewed, good practice is documented and transferred into the wider school, members are thanked and celebrated, and relationships formed in the team become a lasting network of collaboration across the institution.

Table 1: Tuckman's stages of team development applied to a school

Stage	What members typically feel and do	Principal's main task
Forming	Polite, cautious, dependent; seeking clarity	Clarify purpose, select members, set ground rules
Storming	Conflict over goals, methods, roles and workload	Normalise conflict, mediate, keep focus on task
Norming	Trust grows; roles and norms agreed	Build norms, encourage feedback and shared leadership
Performing	Autonomous, flexible, productive teamwork	Delegate, resource, challenge and recognise
Adjourning	Pride and sadness; reflection on ending	Review, document learning, celebrate and thank

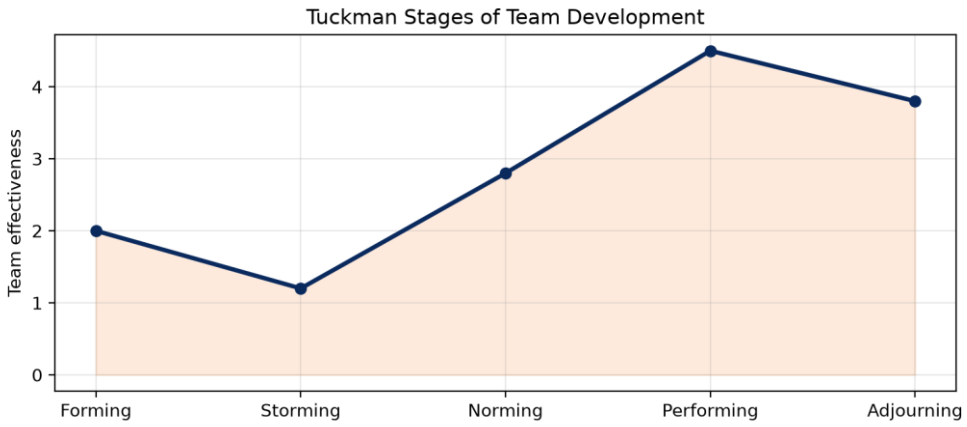

Figure 1: Team effectiveness typically dips during storming before rising through norming to performing.

How the Principal Guides Teachers Through the Stages

In forming, the principal's guidance must be directive and clarity-giving. The principal selects members deliberately for complementary skill, experience and attitude rather than by availability alone, keeps the team small enough to work, states the purpose in terms of student benefit, defines the expected product and deadline, provides time inside the timetable rather than relying on goodwill after school, and helps the team agree its ground rules and first achievable tasks. An early small success, deliberately engineered, gives a new team the confidence on which later ambition can be built. The principal also explains, in advance, that disagreement will come and will be treated as a normal part of development, which greatly reduces the shock of the next stage.

In storming, the principal must neither crush conflict nor abandon the team to it. The task is to keep disagreement attached to issues, evidence and student interests rather than personalities: restating the common goal, insisting that criticism address proposals and data, giving quieter members protected space to speak, mediating workload disputes fairly, and revisiting decisions about roles and methods that the evidence shows to be unworkable. The principal should expect a temporary dip in enthusiasm, remain visibly calm and confident, and resist two opposite errors, dissolving the team at the first quarrel, which teaches staff that resistance always wins, and imposing silence, which drives conflict underground. Where conflict reveals a genuine problem of skill or commitment, coaching, training or a change of membership may be necessary, handled fairly and privately.

In norming and performing, the principal's style should shift from directing to enabling. Shared leadership is encouraged by rotating responsibilities, letting the team set its own meeting routines and internal deadlines, and requiring the team, rather than the principal, to present its progress and problems. The principal supplies what only the principal can supply: timetable space, resources, protection from competing initiatives, access to data, training in collaborative skills such as giving feedback and analysing assessment, and a public account of the team's work that gives it standing in the school. Recognition becomes a deliberate tool, celebrating team achievement rather than only individual stars, because reward systems teach staff whether collaboration is truly valued. At the same time the principal guards quality by keeping an external challenge alive, through targets, peer review and comparison with results, so that a cohesive team remains an improving team and does not settle into comfortable routine.

Across all stages, the principal builds the conditions that make team development possible in a school at all: trust through fairness and follow-through, psychological safety so that teachers can admit difficulty and ask for help, adequate and protected collaborative time, and stability of membership long enough for a team to mature. The principal also monitors the team's stage honestly. A newly combined department cannot be judged by performing standards in its first month, and a mature team should not be micro-managed as if it were still forming. Matching leadership behaviour to developmental stage, directive at the start, supportive through conflict, delegating at maturity and appreciative at the end, is the practical heart of team leadership.

Conclusion

To conclude, teams develop through forming, with its polite uncertainty; storming, with its necessary and dangerous conflict; norming, in which trust, roles and shared ways of working are established; performing, in which the mature team directs its energy to results; and adjourning, in which work is completed, learned from and celebrated. A school principal guides teachers through these stages by clarifying purpose and membership at the start, normalising and mediating conflict without suppressing it, building healthy norms and shared leadership as trust grows, delegating, resourcing and recognising at maturity, and closing the work well at its end. Teams are not declared into existence; they are developed, stage by stage, by leadership that understands the journey and accompanies teachers through all of it, especially through the storm.
